IT 112 – WEB SYSTEMS AND TECHNOLOGIES

BSIT, BLOCK 2C

2nd Sem., S.Y. 2025 – 2026

BARANGAY E-SERVICES

PHASE 4 - FORM SUBMISSION AND DATA INSERTION

Submitted by:

DIGITALIS IMPERIUM

ROPEREZ, HARVAE ALECKS

Project Manager & Database Manager

MATIAS, ANA JOY B.

GitHub Manager

SANIN, JANIN A.

Database Manager

BALLARAN, KLARIZZE C.

Front-End Manager

CAIGAS, JACINTH D.

Back-End Developer

Submitted to:

DR. GUILLERMO V. RED, JR.

IT 112 Professor

CONTRIBUTIONS:

Roperez, Harvae Alecks

The Project Manager and Database Manager roles I held in the project required me to lead team organization and manage all technical aspects of our system.

The Project Manager role required me to create our task schedule while I assigned responsibilities to team members and verified their progress. I helped the team follow our planned schedule through my work in project timeline management which ensured we met all deadlines although we often experienced scheduling problems that forced us to work at the last minute. I took responsibility for team communication through which I assisted in resolving problems and misunderstandings to maintain our workflow.

The Database Manager role required me to establish the database system structure and its organizational framework. I ensured that our data storage system provided proper data storage functions which enabled users to organize and access information. I worked to maintain database security and operational efficiency because I wanted the system to function without any interruptions.

Matias, Ana Joy B. (*GitHub Manager*)

As the GitHub Manager for this project, I became the owner of the project's version control methodology and the development environment. My main task was to organize the repository in such a way that the development team could work simultaneously without damaging the quality of the code. It was my responsibility to set up the branching process and the repository organization. I created a workflow (like GitFlow and Feature Branches) in order to keep the main code base functional and at the same time enable developers to develop additional features. The creation of such an environment was necessary for avoiding any mistakes in further development and keeping track of our project history.

I had a role of handling all the Pull Requests (PRs) and making sure that new codes were added after the code review. Conflict resolution was an important part of my job as I had to deal with difficult merge conflicts that occurred in case several people worked on the same component of the program simultaneously.

For the purpose of fostering transparency among team members, I contributed to the curation of the project's README file and technical documentation, where I outlined how to set up and contribute to the project. Additionally, I leveraged GitHub issues and projects for tracking technical debt and defects, connecting the project level to the technical level. Through keeping the codebase clean and organized in our GitHub repository, I maintained its sustainability.

Sanin, Janin A. (*Database Manager*)

My main contribution to the project was building the structure of our system's database from scratch. I organized everything so that our data stayed safe while making it easy for users to find

what they needed. I also kept a close eye on the system's performance to make sure it stayed fast and never crashed when we needed it most. Along with the technical work, I also helped with the project documentation so that all our processes and requirements were clearly recorded. By working closely with the rest of the team, I made sure our database features actually solved the problems our users were facing. All of this work in managing data and documentation was a huge part of getting the project finished successfully.

Caigas, Jacinth D. (*Back-End Developer*)

In my role as a Backend Developer, I led the design and development of the server architecture, making sure that the logic behind our software was strong and scalable. It was my duty to create RESTful APIs as well as integrate third-party applications that would allow communication between the user interface and our database. In order to increase efficiency, I concentrated on coding in a way that required less processing power, which made the application run much faster. As far as system stability is concerned, I paid attention to implementing error-handling mechanisms and automated tests that enabled us to detect and fix critical issues.

Ballaran, Klarizze C. (*Frontend Developer*)

As the Frontend Developer for this project, my main responsibility was to design, build, and maintain the user interface, ensure smooth interaction between the user and the system, and integrate all features with the backend database. I focused on creating a system that is not only visually appealing but also functional, user-friendly, and reliable. Throughout the development process of this project my main job was to adjust the frontend pages I already built to match exactly with the backend system.

I made sure all functions and data fields align properly so they work together perfectly. My biggest contribution was modifying the existing design and features to fit what the backend needed, especially for the new Release Date function. I updated how data is sent and received, fixed any connection issues, and ensured everything displays correctly. I also did testing to check if the frontend connects properly to the backend. I verified that data saves, loads, and shows up correctly, and made sure all original features still work well. Additionally, I organized my code and wrote clear setup instructions so others can run the project easily. In short, I adjusted the frontend to match the backend perfectly, tested the connection between them, and made sure the whole system works smoothly.
